

Orbit Website — What's Changing, and Why

For: the executive team and engineering (Karthik). **About:** everything in the current working version of the site that hasn't been published yet. **Goal:** so everyone — technical or not — understands what we built, what we reused from the old Wix site, and the thinking behind the big decisions.

In one minute

We took the new website from a rough scaffold to **launch-ready**. In plain terms:

- **Booking a demo now works smoothly.** One clean, on-brand pop-up, no glitches.
- **We can finally measure what's working** — which pages convert, where people drop off — with privacy handled properly.
- **We're on the right side of the law** — a cookie banner and updated privacy/terms built for India's DPDP Act and Europe's GDPR.
- **The site is fuller and more polished** — a careers section, a smarter homepage, a branded "page not found" screen, and cleaner visuals throughout.

Nothing is live yet. This is the review before we publish.

By the numbers: ~130 files updated, 70 new, 50 removed. Roughly 3,500 lines changed.

What changed, explained

Each item below is written for everyone, with a short **Technical note** for engineering.

1. Booking a demo — the thing that earns us money

Orbit is a premium, high-touch product, so the website's single most important job is to get the right person onto a call. Every "Book a Demo" button now opens **one consistent, brand-styled scheduling pop-up**. We deliberately did **not** build an online checkout — a conversation converts far better than a shopping cart for a product at this price and stage.

We also fixed a rough edge: on desktop the scheduler used to show an ugly inner scrollbar. It now sizes itself perfectly to the content.

Technical note: the booking pop-up is a global `CalendlyModal` opened via a custom event; CTAs render `BookDemoButton`. The scrollbar fix replaces the hand-coded `<iframe>` with Calendly's official `widget.js` + `initInlineWidget({ resize: true })`, which auto-sizes to content (a raw iframe can't — its scrollbar sits inside Calendly's own document, untouchable by our CSS). A booking fires the `schedule_demo` conversion event.

2. Knowing what works — analytics

Until now we were flying blind. The site now reports into **Google Analytics 4** (a fresh, clean account) and **Microsoft Clarity** (which records anonymized session playbacks and heatmaps, so we can literally watch where people hesitate). We track the moments that matter: demo bookings, career applications, FAQ opens, contact clicks, and how far people get in the interactive report.

Technical note: GA4 `G-F75KF0N3SH` via `@next/third-parties`; Clarity `x9xec923ng`. Events run through one helper (`lib/analytics.ts`) that dual-fires to GA4 + Vercel. Key events: `schedule_demo`, `careers_apply`.

3. Asking permission — consent & privacy

Because Orbit deals with sensitive brain and body data, we're held to a high bar. The site now shows a **cookie consent banner**, and analytics stay **switched off until the visitor agrees**. The Privacy Policy and Terms were rewritten to cover India's DPDP Act and Europe's GDPR — including explicit consent for biometric data, the right to withdraw, and a named point of contact for data questions.

Technical note: Consent Mode v2 — defaults to "denied", upgrades on accept (`CookieConsent.tsx` + `lib/consent.ts`). Clarity loads only after consent. Personal-data form fields are masked in recordings.

Needs a human: a real Grievance Officer name and a lawyer's final sign-off.

4. New pages

- **Careers** — real job listings with their own detail pages and an application form (with résumé upload) that emails applications to the team.
- **Privacy Policy & Terms** — rewritten and expanded (see above).
- **Styleguide** — an internal, hidden page documenting our colors, fonts, and components so the site stays consistent as it grows.

5. A smarter homepage

We resequenced the homepage to tell a tighter story — problem, product, proof — and added sections that build trust: the CES launch moment, partner credibility, real press highlights, and the team. We

removed a pile of leftover early-draft sections that no longer fit.

6. The interactive report tour

The `/report` walkthrough that shows a sample Orbit report was rebuilt to feel on-brand. One busy, hard-to-read "rainbow" chart was redrawn cleanly so it's legible on phones.

Technical note: the chart is now a coded SVG (`CognitiveStateTimeline.tsx`) using brand color tokens, not an exported image — so it stays on-brand and needs no re-export.

7. A consistent look

We built a small kit of reusable building blocks (buttons, badges, section layouts, accordions) so every page looks like it belongs to the same product, and so future changes are faster and safer.

8. Polish

- A **branded "page not found" (404)** screen — if someone hits a broken or hidden link, they get an on-brand page with a way back, not a blank error.
- A **custom social-share image** — when the site is shared on LinkedIn, X, or WhatsApp, it shows a designed preview with our logo and tagline.
- Cleaner imagery throughout, with the whole image library tidied and consistently named.

Technical note: `app/not-found.tsx` ; the middleware now renders this branded page (with a real 404 status + `noindex`) for hidden routes instead of a blank body. The share image is generated in code (`app/opengraph-image.tsx`), so there's no static asset to maintain.

What we reused from the old Wix site

We didn't start from a blank page. The Wix site was our **content and image source**. Using a Wix access key and a small fetch script, we pulled across and optimized:

- **Product and lifestyle photos** — the Orbit device renders and the hero imagery (executives, athletes, musicians, and so on).
- **Credibility logos** — partners (IIT Madras, BIRAC, IAF, and more), press, and CES 2025.
- **Press & news highlights** — the real LinkedIn posts, the Ather investment article, the founder's story.
- **Team** — the photos and the confirmed roster of names and roles.
- **Careers** — the actual job descriptions.

- **Copy** — the FAQ answers, the \$250 price, phone number, social links, and the **starting text for the Privacy Policy and Terms** (which we then expanded).

What we did **not** carry over: Wix's analytics account (we started clean), its page structure, or its third-party form embeds (which couldn't be measured properly).

The big decisions, and the reasoning

Decision	Why
Book a demo, no online checkout	Premium, high-touch product — a sales conversation converts better than a cart, and it avoids building payments before launch.
A fresh analytics account, not Wix's	Wix's data is tangled and mis-configured. A clean start means we can trust the numbers from day one. The old account stays untouched on the live Wix site until we switch over.
Cookie banner + consent built in	We handle biometric and analytics data; Indian and EU law require clear, withdrawable consent.
Charts and the share image are "drawn in code," not exported pictures	They always match our brand, read well on mobile, and never need re-exporting when the brand evolves.
Some pages built but hidden (<code>/buy</code> , athletes, executives, etc.)	They're ready behind a switch, so we can launch lean now and turn them on without a rebuild.
American spelling + USD pricing	Matches the audience and the price we present.

Before we go live

A short, honest checklist of what's still owed — most of it is configuration, not building:

- **Settings:** add the analytics, Calendly, site, and email keys in our hosting (Vercel), then redeploy.
- **Email:** confirm the Calendly account and verify our email-sending domain so career applications actually arrive.
- **Legal:** name a Grievance Officer and get a lawyer's sign-off on Privacy/Terms.
- **Analytics setup:** mark the key conversions, set data retention, and exclude our own team's traffic.
- **Search:** verify the domain with Google Search Console and submit the sitemap.
- **Go-live:** point the `neuro-stellar.com` domain from Wix to the new site.

For engineering — shipping this safely

- This work is **uncommitted**. Commit it on a branch and open a PR; don't push straight to `main`.
- It **will conflict** with the latest `main` commit `c7dcf4e` ("refine CTA copy, footer socials, and section polish"), which edits 5 files we also changed: `app/page.tsx`, `components/layout/Footer.tsx`, `components/sections/ProblemStatement.tsx`, `components/sections/ProductDemo.tsx`, `lib/cta-content.ts`. Reconcile those by hand.
- `npm run verify` (lint, types, tests, link check, build) must pass — it does today.
- Commit once so line endings (LF→CRLF) normalize together, or later diffs look noisy.
